McCORMICK
STEVENSON
ENGINEERING+DESIGN

Delivery of technical documentation that exceeds the expectations of your customers can be difficult to accomplish alongside the many tasks associated with project completion. McCormick Stevenson offers a Technical Writing team that works closely with your Subject Matter Experts (SMEs) to understand application requirements and develop superior deliverables for your project. We believe that technical writing is the process of researching and clearly documenting specialized topics in a manner easily understood by the intended audience. A process which we apply to the creation, revision, and development of a variety of document types for internal, commercial, and government applications.

We specialize in developing documents and technical illustrations that meet government and military requirements. In close collaboration with your team, our process begins with a thorough review of regulatory and statutory requirements compliant with ISO9001 and AS9100 quality standards, as well as a careful analysis of all program requirements as specified in the Contract Data Requirements List (CDRL), Data Item Description (DID), or Statement of Work (SOW). We match your internal document standards to maintain a consistent look and feel, and to ensure that all deliverables support your branding intent. Our aim is to provide a seamless technical documentation service for all participants in the product lifecycle – including development, production, and support.

Let McCormick Stevenson help you:

- Write new content based on your project and/or product requirements
- Leverage existing content to develop further, reuse or repurpose
- Employ industry-standard applications and best practices
- Provide engineering support that enhances your documentation
